

DIY TERRARIUM INSTRUCTIONS

Add a little green to your indoor space with an eye-catching terrarium! Not only are they a great oxygen booster, terrariums are easy to create and can be made in a variety of sizes. Change up the container to fit into any décor.

- Container
- Activated charcoal pieces
- Potting soil
- colored sand or rocks
- Terrarium plants (tropical or succulents)
- moss
- accessories (people, shells, rocks etc)
- water

Install approximately 1-2 inches of charcoal at base of container.

Add layers of colored soil or sand

Fill your container one-fourth to one-third full with soil. Gently pack.

Carefully remove your plants from their containers and position them on top of the soil to ensure proper spacing. Allow enough room between the plants for additional soil.

Use your hands to pack soil in and around plants. Tuck plants deep enough into the soil to cover all plant roots and to keep the plants from reaching too far above the top of the container.

Position moss and other objects on top of the soil and between the plants.

Add top layer of colored sand and /or rocks

Water plants and place container in a well-lit area with indirect light. Future watering is dependent on the types of plants you have selected and the environment they're growing in. Test the soil for moisture before pulling out the watering can.

Maintenance is minimal once the plants are established. As they grow you may want to trim them.
